The Pro100 is the most advanced radar, laser and safety detector ever designed by Beltronics. The Pro100 includes full X, K, SuperWide Ka, and Safety Warning System radar capability, front and rear laser detection, varactor-tuned (VTO) microwave receiver, digital signal processing (DSP) for superior range and reduced false alarms, our patented Mute and AutoMute, audible and visual band alerts, and all the performance you'd expect from Beltronics.

In addition, the Pro100 introduces the following revolutionary features:
- Varactor-tuned receiver provides long-range protection against all radar threats
- New easy-to-use Programming lets you customize up to 6 features
- Ultra-bright text-display provides easy to read information from any angle
- Detects and decodes Safety Warning System messages

If you've used a radar detector before, a review of the Quick Reference Guide on pages 4 and 5, and the Programming information on pages 12 and 13 will briefly explain the new features.

If this is your first detector, please read the manual in detail to get the most out of your Pro100’s outstanding performance and innovative features.

Please drive safely.

Congratulations

Register
online:

www.beltronics.com

There are 6 user-selectable options so you can customize your Pro100 for your own preferences. The buttons labeled CITY and BRT are also used to enter the Program Mode, REVIEW your current program settings, and to CHANGE any settings as desired. The words PGM, RVW, and CHG are located on the top of the detector, and are highlighted in graphics.

How to use Programming

1. To enter Program Mode, press and hold both CITY and BRT buttons down for 2 seconds. The unit will beep twice, and will display the word Program.
2. Then press the RVW button to review the current settings. You can either tap the button to change from item to item, or hold the button to scroll through the items.
3. Press the CHG button to change any setting. You can either tap the button to change from setting to setting, or hold the button to scroll through all the options.
4. To leave Program Mode, simply wait 8 seconds without pressing any button. The unit will display Complete, beep, and return to normal operation.

An example

Here is how you would turn the Pro100’s AutoMute feature off.

1. Enter the Program Mode by holding both the CITY and BRT buttons down for 2 seconds. The Pro100 will beep twice and display Program.
2. Then hold the RVW button down. Pro100 will scroll through the categories, starting with Display (Disp), then Voice (Voice), then Power-On sequence (PwrOn), and then AutoMute (aMute).
3. Release the RVW button when the Pro100 shows the AutoMute item. Since the factory setting is for AutoMute to be on, the Pro100 will display aMute ON.
4. If you accidentally don’t release the Review button in time, and the Pro100 goes to the next category, hold the RVW button down again, and after the Pro100 scrolls through all categories, it will begin again at the top of the list.
5. Press the CHG button to change from aMute ON to aMute OFF.
6. To complete the Programming, simply wait 8 seconds without pressing any button. The Pro100 will display Complete, beep 4 times, and return to normal operation.

FCC Note:
Modifications not expressly approved by the manufacturer could void the user’s FCC granted authority to operate the equipment.

Factory Default Settings
To reset your Pro100 to its original factory settings, press and hold the CITY and BRT buttons while turning the power on. The Pro100’s display will provide a Reset message, accompanied by an audible alert, acknowledging the reset.

Quick Reference

Press the RVW button to go from one category to the next

PILOT
(Power-on indication)

* Full word: Highway or City
Letter: H or C

VOICE

* Voice alerts on
Voice alerts off

POWER-ON SEQUENCE

* Standard power-on sequence
Fast power-on sequence

AUTOMUTE

* AutoMute on
AutoMute off

CITY MODE SENSITIVITY

* Standard City mode sensitivity
Low X band sensitivity in City Mode

BANDS

* Factory default settings
Factory default settings modified

- Turn bands ‘ON’ or ‘OFF’ by pressing the VOLUME/MUTE button

* Factory Default Settings
Radar Antenna and Laser Lens
The rear panel of your Pro100 should have a clear view of the road ahead. For best performance, do not mount the Pro100 directly behind windshield wipers or tinted areas. Page 6

Quick Mount Slot
Insert the Pro100’s adjustable Windshield mount into this slot. Page 7

Quick Mount Button
Press the button, and slide the Windshield mount into one of its four locking positions. Page 7

City Button
Switches between City and Highway settings. In general, we recommend Highway. Page 9

Power
Press the PWR button to turn the Pro100 on or off.

Auto Mute
Your Pro100’s patented AutoMute automatically reduces the volume level of the audio alert after a brief period. If you prefer, you can turn AutoMute off. Page 8

Programming
Your Pro100 is ready to go, just plug it in and turn it on. But you can also easily change 6 features for your preferences. Page 12-14

Alphanumeric Matrix Display
Your Pro100’s display will show Highway or City as its power-on indication. If you prefer, you can choose other power-on indications. Page 12-14

During an alert, the display will indicate radar band, and a precise bar graph of signal strength. Page 10

NOTE: In the Dark Mode the display will not light during an alert. Page 9

Rear Laser Port
Receives laser signals from behind the vehicle.

Earphone Jack
Accepts standard mono 3.5mm earphone.

Brightness Button
Press to adjust display brightness. There are three brightness settings, plus Dark Mode. In the Dark Mode, the power-on indication will be changed to a “HD” or “CD” (indicating Highway Dark or City Dark). In the Dark Mode, the Pro100’s meter will not display during an alert, only the audio will alert you. Page 9

Power Jack
Plug the power cord into this connector. Page 6

Volume and Mute Button
Press and hold the Volume/Mute button to adjust the alert volume level. Page 8

Briefly press this button to silence the audio for a specific alert. (The audio will alert you to the next encounter.) Page 8

Quick Reference Guide

To begin using your Pro100, just follow these simple steps

1. Plug the small end of the power cord into the side jack of the detector, and plug the large end of the power cord into your car’s lighter socket.

2. Mount your Pro100 on the windshield using the supplied windshield mount.

3. Press the PWR button, located top left, to turn the Pro100 on.

4. Press and hold the Volume/Mute button to adjust the volume.

Please read the manual to fully understand your Pro100’s operation and features.
Power Connection
To power your Pro100, plug the small end of the power cord, (telephone-type connector) into the modular jack on the Pro100’s right side, and plug the lighter plug adapter into your vehicle’s lighter socket or accessory socket.

Your Pro100 operates on 12 volts DC negative ground only. The lighter plug provided is a standard size and will work in most vehicles. However, some vehicles may require the optional European sleeve to ensure a snug fit. If so, simply call our service department to order one. This sleeve slides over the lighter plug. Of course, your lighter socket must be clean and properly connected for proper operation.

NOTE: Depending on your vehicle, the lighter socket power may either be continuously on, or it may be switched on and off with your ignition switch.

Optional power cords
See the Accessories section for details on our optional coiled SmartCord or Direct-wire power cords. Page 25

Mounting Location
WARNING: Beltronics cannot anticipate the many ways the Pro100 can be mounted. It is important that you mount your Pro100 where it will not impair your view nor present a hazard in case of an accident.

Where to mount your Pro100
For optimum detection performance, we recommend the following:

• Using the QuickMount bracket, mount your Pro100 level, and high enough on your front windshield to provide a clear view of the road from the front and rear.

• Mount the Pro100 away from windshield wipers, other solid objects, and heavily tinted areas that might obstruct the radar antenna or laser lens.

Windshield QuickMount
The Pro100’s QuickMount bracket is designed for unobtrusive and hassle-free mounting.

1. Depress the QuickMount button on the top of the Pro100 (by the word BELTRONICS) and slide the QuickMount bracket into the slot until it is locked into the position which best fits the angle of your windshield (there are four settings available). For extremely horizontal or extremely sloped windshields, the QuickMount bracket can be bent.

2. To adjust the Pro100 on your windshield, use the QuickMount adjustment button located on the top of the Pro100, and slide the Pro100 forward or backward to obtain a level horizontal position.

When installed and adjusted properly, the back top edge of the Pro100 should rest solidly against your windshield.

Caution!
A few vehicles (including some Porsches) have windshields with a soft anti-lacerative coating on the inside surface. Use of suction cups will permanently mar this coating. Consult your dealership or the vehicle owner’s manual to determine if your windshield has this coating.

User’s Tip
You can leave the QuickMount bracket in place on your windshield, and easily remove the Pro100 by pressing the adjustment button and sliding the Pro100 off the mount. Again, be sure to position the bracket where it won’t present a hazard in the event of an accident. Additional mounts are available.
Power
To turn your Pro100 on or off, press the PWR button located on the top. When you turn your Pro100 on, it goes through a sequence of alerts.
If you prefer, you may program your Pro100 for a shorter power-on sequence. See the Programming section for details.

Volume
Press and hold the Volume/Mute button located on the top case to adjust the Pro100’s alert volume level. The audio will ramp up and down, accompanied by a bar graph on the display. Once you’ve reached your preferred audio level, simply release the button.

Power-on indication
After the Pro100’s start-up sequence is complete, the alphanumeric display will show Highway or City to indicate which sensitivity mode is selected.
If you prefer, you can select alternate power-on displays. See the Programming section for details.

Voice Alerts
The Pro100 provides digital voice announcements of radar and laser bands detected. If Safety Radar (SWS) is turned on, a safety radar message will also be announced. See the Programming section for details.
If you prefer, you can turn Voice Alerts off. See Programming section for details.

AutoMute
Your Pro100 has our patented AutoMute feature. After the Pro100 alerts you to a radar encounter at the volume you have selected, the AutoMute feature will automatically reduce the volume to a lower level. This keeps you informed without the annoyance of a continuous full-volume alert.
If you prefer, you can turn the AutoMute feature off. See the Programming section for details.

Mute
The Mute button, located on the Pro100’s top case, allows you to silence the audio alert during a radar encounter.
To mute the audio for a single specific signal, briefly press the Mute button. After that radar encounter has passed, the mute will automatically reset and the audio will alert you to the next encounter.

Highway / City Button
The City button selects the Pro100’s sensitivity mode. We recommend the Highway mode for most driving.
When driving in urban areas where annoying X-band intrusion alarms and door openers are common, City mode can be engaged to lower X-band sensitivity and reduce X-band alerts. Full sensitivity is maintained on all other bands. See the Programming section for details.

Brightness
The Pro100’s BRT button selects the brightness of your Pro100’s display. There are four settings: Maximum, Medium, Minimum, and Dark. Press the BRT button to select your preferred brightness.

Dark Mode
When you select the Dark mode with the BRT switch, your Pro100 changes to a very inconspicuous power-on indication: a very Dim HD or CD. (In this display, the H or C indicates Highway or City, and the D indicates Dark.)
When the Pro100 is in the Dark mode, the display will not show visual alerts when Pro100 detects signals. Only the audible alert will tell you of detected signals.
Controls and Features

Audible Alerts

For Radar signals:
Your Pro100 uses a Geiger-counter-like sound to indicate the signal strength and type of radar signal being encountered.

When you encounter radar, a distinct audible alert will sound and occur faster as the signal gets stronger. This allows you to judge the distance from the signal source without taking your eyes from the road.

Each band has a distinct tone for easy identification.

X-band = chirping
K-band = buzzing
Ka-band = double-chirp
POP = full double-chirp

For Laser and POP signals:
Since laser and POP signals (if turned on) are a possible threat no matter how weak, the Pro100 alerts you to these bands at full strength.

For Safety signals:
Your Pro100 will alert you to these signals with a double-beep tone, and a corresponding text message. A complete listing of the text messages is on page 21.

Power Connector

The Pro100’s power jack uses a telephone-type connector. This 4-conductor connector only works with the included power cord, or optional Direct-wire and SmartCord.

For more information or to order, call us toll-free at 1-800-341-2288.

Signal Strength Meter

Your Pro100’s alphanumeric display consists of 280 individual LEDs, to provide an intuitive ultra-bright display of signal strength and text messages.

The Pro100’s standard bar-graph signal strength meter only displays information on a single radar signal. If there are multiple signals present, the Pro100’s internal computer determines which is the most important threat to show on the bar-graph meter.

When your Pro100 detects radar, it displays the band (X, K, or Ka), and a precise bar-graph of the signal strength. When your Pro100 detects a laser signal, the display will show LASER.

NOTE: If you are operating the Pro100 in the Dark mode, the display will not light when a signal is detected, only the audio will be heard.

Programming

There are 6 user-selectable options so you can customize your Pro100 for your own preferences. The buttons labeled CITY and BRT are also used to enter the Program Mode, REVIEW your current program settings, and to CHANGE any settings as desired. The words PGM, RVW, and CHG are located on the top of the detector, and are highlighted in colored graphics. Pages 13-14 explain each option in more detail.

How to use Programming

1 Enter the Program Mode by holding both the CITY and BRT buttons down for 2 seconds. The Pro100 will beep twice and display Program.

2 Then press the RVW button to review the current settings. You can either tap the button to change from item to item, or hold the button to scroll through the items.

3 Press the CHG button to change any setting. You can either tap the button to change from setting to setting, or hold the button to scroll through all the options.

4 To leave the Program Mode, simply wait 8 seconds without pressing any button, or press the PWR button. The unit will display Complete, beep 4 times, and return to normal operation.

An example

Here is how you would turn your Pro100’s AutoMute feature off.

1 Enter the Program Mode by holding both the CITY and BRT buttons down for 2 seconds. The Pro100 will beep twice and display Program.

2 Then hold the RVW button down. The Pro100 will scroll through the categories, starting with Pilot (Pilot), Voice (Voice), Power-on sequence (PwrOn), and then AutoMute (aMute).

3 Release the RVW button when the Pro100 shows the AutoMute item. Since the factory setting is for AutoMute to be on, the Pro100 will display aMute ON.

If you accidentally don’t release the RVW button in time, and the Pro100 goes to the next category, hold the RVW button down again, and after your Pro100 scrolls through all categories, it will begin again at the top of the list.

4 Press the CHG button to change from aMute ON to aMute OFF.

5 To complete the Programming, simply wait 8 seconds without pressing any button, or press the PWR button. The Pro100 will display Complete, beep 4 times, and return to normal operation.

Details of Programming

* Factory Default Settings
To reset your Pro100 to its original factory settings, press and hold the “CITY” and “BRT” buttons while turning the power on. The Pro100’s display will provide a “Reset” message, accompanied by an audible alert, acknowledging the reset.

Press the CHANGE button to change your setting within a category

Pilot (Power-on indication)
- Full word: Highway or City
- Letter: H or C

Voice
- Voice On
- Voice Off

Power-on Sequence
- PwrOn STD
- PwrOn FST

AutoMute
- aMute On
- aMute Off

City Mode Sensitivity
- City STD
- City LoX

Bands
- Bands DFT
- Bands MOD

Turn bands “ON” or “OFF” by pressing the VOLUME/MUTE button

POP
- ON or OFF (default is off)

SWS
- ON or OFF (default is off)

TSR
- ON or OFF (default is off)

Pilot (Power-on indication)
NOTE: When you are using the Dark mode, the display will only show HD or CD (Highway-Dark or City-Dark).

Pilot HWY (Full description)
In this setting, your Pro100 will display “Highway” or “City” as its power-on indication. (factory default)

Pilot H (Letter)
In this setting, your Pro100 will display “H” for Highway and “C” for City.

Voice
- Voice On (Voice announcements on)
- Voice Off (Voice announcements off)

Power-on Sequence
- PwrOn STD (Standard)
- PwrOn FST (Fast power-on)

AutoMute
- aMute On (AutoMute on)
- aMute Off (AutoMute off)

Factory Default Settings
To reset your Pro100 to its original factory settings, press and hold the “CITY” and “BRT” buttons while turning the power on. The Pro100’s display will provide a “Reset” message, accompanied by an audible alert, acknowledging the reset.

In this setting, each time you turn on your Pro100, it will display “Pro100,” “Laser,” “K-band,” “X-band,” “Safety,” followed by a brief X-band alert. (factory default)

If any bands have been changed from the factory default settings, a double X-band tone and corresponding message (i.e., “SWS ON”), will alert you that one or more bands have been changed.

In this setting, your Pro100 will provide a single X-band tone. If any bands have been changed from the factory default settings, a double X-band tone and corresponding message (i.e., “SWS ON”), will alert you that one or more bands have been changed.

In this setting, your Pro100’s audio alerts will initially be at the volume you set, but after a few seconds, the Pro100 will automatically reduce the volume level, to keep you informed, but not annoyed. (factory default)

With AutoMute off, your Pro100’s audio alerts will remain at the volume you set for the duration of the radar encounter.
City Mode Sensitivity

City STD (Standard)
In this setting, when you put your Pro100 in the City mode, X-band sensitivity is significantly reduced, to reduce annoyance from X-band intrusion alarms and motion sensors. (factory default)

City LoX (Low X band sensitivity)
In this setting, when you put your Pro100 in the City mode, X-band sensitivity is reduced more than the standard setting. This will reduce X-band alarms from other sources even further, but also significantly reduces range to X-band traffic radar.

Bands

Bands DET
In this setting, all North American radar and laser frequencies are monitored. This is the factory setting and it is recommended that you use your Pro100 in this mode.

Bands MOD
In this setting, your Pro100 will warn you with an audible alert, and associated text message stating which band has changed from the original factory setting (i.e. “SWS ON”). This warning is displayed during the start up sequence (standard or fast).

Features and Specifications

Operating Bands
- X-band 10.525 GHz ± 25 MHz
- K-band 24.150 GHz ± 100 MHz
- Ka-band 34.700 GHz ± 1300 MHz
- Laser 904nm, 33 MHz bandwidth

Radar Receiver / Detector Type
- Superheterodyne, VTO
- Scanning Frequency Discriminator
- Digital Signal Processing (DSP)

Laser Detection
- Quantum Limited Video Receiver
- Multiple Laser Sensor Diodes

Display Type
- 280 LED Alphanumeric
- Bar Graph
- 3 Levels of Brightness, plus Dark Mode

Power Requirement
- 12VDC, Negative Ground
- Power cord (included)

Programmable Features
- Power-On Indication
- Voice Alerts
- Power-On Sequence
- AutoMute
- City Mode Sensitivity
- Bands

Sensitivity Control
- Highway and City

Auto Calibration Circuitry

VG2 Immunity

Dimensions (Inches)
- 1.25 H x 2.75 W x 4.75 L
## Technical Details

### Interpreting Alerts
Although the Pro100 has a comprehensive warning system and this handbook is as complete as we can make it, only experience will teach you what to expect from your Pro100 and how to interpret what it tells you. The specific type of radar being used, the type of transmission (continuous or instant-on) and the location of the radar source affect the radar alerts you receive.

The following examples will give you an introduction to understanding the your Pro100’s warning system for radar, laser and safety alerts.

### Alert

<table>
<thead>
<tr>
<th>Explanation</th>
<th>Alert</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are approaching a continuous radar source aimed in your direction.</td>
<td>The Pro100 begins to sound slowly, then the rate of alert increases. The Signal Meter ramps accordingly.</td>
</tr>
<tr>
<td>An instant-on radar source is being used ahead of you and out of your view.</td>
<td>The Pro100 emits short alerts for a few seconds and then falls silent only to briefly alert and fall silent again.</td>
</tr>
<tr>
<td>An instant-on radar source or laser source is being used nearby. This kind of alert requires immediate attention!</td>
<td>The Pro100 suddenly sounds a continuous tone for the appropriate band received. All segments in the Signal Strength Meter are lit.</td>
</tr>
<tr>
<td>Laser is being used in the area. Because laser is inherently difficult to detect, any laser alert may indicate a source very close by.</td>
<td>A brief laser alert.</td>
</tr>
<tr>
<td>Signals may be a little stronger as you pass large, roadside objects. The signals increase in frequency.</td>
<td>The Pro100 receives weak signals. These signals are reflected (reflections are increased by large objects), they may or may not eventually melt into a solid point even when the patrol car is directly behind you.</td>
</tr>
</tbody>
</table>

### Explanation

<table>
<thead>
<tr>
<th>Explanation</th>
<th>Alert</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are approaching a radar unit concealed by a hill or an obstructed curve.</td>
<td>The Pro100 alerts slowly for a while and then abruptly jumps to a strong alert.</td>
</tr>
<tr>
<td>A patrol car is traveling in front of you with a radar source aimed forward. Because signals are sometimes reflected off of large objects and sometimes not, the alerts may seem inconsistent.</td>
<td>The Pro100 alerts intermittently. Rate and strength of alerts may be inconsistent or vary wildly.</td>
</tr>
<tr>
<td>A patrol car is approaching from the other direction, sampling traffic with instant-on radar. Such alerts should be taken seriously.</td>
<td>The Pro100 alerts intermittently. Rate and strength of signal increases with each alert.</td>
</tr>
<tr>
<td>You are driving through an area populated with radar motion sensors (door openers, burglar alarms, etc.). Since these transmitters are usually contained inside buildings or aimed toward OR away from you, they are typically not as strong or lasting as a real radar encounter.</td>
<td>The Pro100 gives an X-band, or K-band alert intermittently.</td>
</tr>
</tbody>
</table>

**CAUTION:** Since the characteristics of these alerts may be similar to some of the preceding examples, overconfidence in an unfamiliar area can be dangerous. Likewise, if an alert in a commonly traveled area is suddenly stronger or on a different band than usual, speed radar may be set up nearby.
Technical Details

How Radar Works
Traffic radar, which consists of microwaves, travels in straight lines and is easily reflected by objects such as cars, trucks, even guardrails and overpasses. Radar works by directing its microwave beam down the road. As your vehicle travels into range, the microwave beam bounces off your car, and the radar antenna looks for the reflections. Using the Doppler Principle, the radar equipment then calculates your speed by comparing the frequency of the reflection of your car to the original frequency of the beam sent out.

Traffic radar has limitations, the most significant of these being that it typically can monitor only one target at a time. If there is more than one vehicle within range, it is up to the radar operator to decide which target is producing the strongest reflection. Since the strength of the reflection is affected by both the size of the vehicle and its proximity to the antenna, it is difficult for the radar operator to determine if the signal is from a sports car nearby or a semi-truck several hundred feet away.

Radar range also depends on the power of the radar equipment itself. The strength of the radar unit’s beam diminishes with distance. The farther the radar has to travel, the less energy it has for speed detection.

Because intrusion alarms and motion sensors often operate on the same frequency as radar, your Pro100 will occasionally receive non-police radar signals. Since these transmitters are usually contained inside of a building, or aimed toward the ground, they will generally produce much weaker readings than will a true radar encounter. As you become familiar with the sources of these pseudo alarms in your daily driving, they will serve as confirmation that your Pro100’s radar detection abilities are fully operational.

How “POP” Works
“POP” mode is a relatively new feature for radar gun manufacturers. It works by transmitting an extremely short burst, within the allocated band, to identify speeding vehicles in traffic. Once the target is identified, or “POPPED,” the gun is then turned to its normal operating mode to provide a vehicle tracking history, (required by law).

Radar range also depends on the power of the radar equipment itself. The strength of the radar unit’s beam diminishes with distance. The farther the radar has to travel, the less energy it has for speed detection.

Because intrusion alarms and motion sensors often operate on the same frequency as radar, your Pro100 will occasionally receive non-police radar signals. Since these transmitters are usually contained inside of a building, or aimed toward the ground, they will generally produce much weaker readings than will a true radar encounter. As you become familiar with the sources of these pseudo alarms in your daily driving, they will serve as confirmation that your Pro100’s radar detection abilities are fully operational.

How Laser (Lidar) Works
Laser speed detection is actually LIDAR (Light Detection and Ranging). LIDAR guns project a beam of invisible infrared light. The signal is a series of very short infrared light energy pulses, which move, in a straight line, reflecting off your car and returning to the gun. LIDAR uses these light pulses to measure the distance to a vehicle. Speed is then calculated by measuring how quickly these pulses are reflected given the known speed of light.

LIDAR (or laser) is a newer technology and is not as widespread as conventional radar, therefore, you may not encounter laser on a daily basis. And unlike radar detection, laser detection is not prone to false alarms. Because LIDAR transmits a much narrower beam than does radar, it is much more accurate in its ability to distinguish between targets and is also more difficult to detect. AS A RESULT, EVEN THE BRIEDEST LASER ALERT SHOULD BE TAKEN SERIOUSLY.

There are limitations to LIDAR equipment. LIDAR is much more sensitive to weather conditions than RADAR, and a LIDAR gun’s range will be decreased by anything affecting visibility such as rain, fog, or smoke. A LIDAR gun cannot operate through glass and it must be stationary in order to get an accurate reading. Because LIDAR must have a clear line of sight and is subject to cosine error (an inaccuracy, which increases as the angle between the gun and the vehicle, increases) police typically use LIDAR equipment parallel to the road or from an overpass. LIDAR can be used day or night.
How Safety Radar Works

Safety Warning System, or SWS, uses a modified K-band radar signal. The SWS safety radar system has 64 possible messages (60 currently allocated). The SWS messages your Pro100 can display are listed on the facing page.

From the factory, your Pro100 is programmed with SWS decoding OFF. If SWS is used in your area, your Pro100 will display the safety messages associated with the signal. If you wish to detect this system, use the Programming feature to turn the Pro100’s SWS decoding ON.

NOTE: Some of the safety messages have been condensed, so that each message can be displayed on one or two screens on the Pro100’s eight-character display.

TSR Traffic Signal Rejection Software

Your radar detector includes a new optional boost in anti-falsing software to eliminate excessive alerts from erroneous X and K-band sources. One example of this is traffic flow monitoring systems. These systems, which are becoming more widely used in several countries, generate K-band signals to measure the flow of traffic on a given road. Unfortunately most detectors see this as a real threat and will alert you to it unnecessarily. Our new proprietary software (TSR), intelligently sorts, ranks and rejects this type of false alarm automatically. The result is ultimate protection without excessive false alarms.

TSR is a programmable option that is defaulted ‘On’ in the bands settings.

If you have any questions about this new feature, please give us a call or visit our website for more details.

**Troubleshooting**

**Problem**

The Pro100 beeps briefly at the same location every day, but no radar source is in sight.

The Pro100 does not seem sensitive to radar or laser.

The Pro100 did not alert when a police car was in view.

The Pro100 did not provide a Safety signal while within range of an emergency vehicle.

The Pro100’s display is not working.

The Pro100’s audible alerts are less loud after the first few alerts.

The Pro100 bounces or sags on windshield.

The Pro100’s power-on sequence reoccurs while you are driving.

**Solution**

• An X or K-band motion sensor or intrusion alarm is located within range of your route. With time, you will learn predictable patterns of these signals.

• Make sure that windshield wipers do not block your Pro100’s radar antenna and that the laser lens is not behind tinted areas.

• Determine if your vehicle has an Instaclear®, ElectriClear® or solar reflective windshield which may deflect radar or laser signals.

• Your Pro100 may be in City Mode.

• VASCAR (Visual Average Speed Computer and Recorder) a stopwatch method of speed detection, may be in use.

• Officer may not have radar or laser unit turned on.

• Your Pro100 may be in City Mode.

• Press the BRT button to deactivate Dark Mode.

• The Pro100 is in AutoMute Mode. See page 8 for details.

• A loose power connection or dirty lighter socket can cause the Pro100 to be briefly disconnected.

---

**Problem**

Your 14-year old son has changed all 6 of the Programming options.

The Pro100 will not turn on.

The Pro100 feels very warm.

**Solution**

• You can return all of the programming options to the factory defaults by holding down the CITY and BRT buttons while you turn the Pro100 on.

• Check that the power is ON.

• Check that vehicle ignition is ON.

• Check that vehicle lighter socket is functional.

• Try the Pro100 in another vehicle.

• It is normal for the Pro100 to feel warm.

---

**Explanation of Displays**

Service

Procedure
If your Pro100 ever needs service, please follow these simple steps:
1. Check the troubleshooting section of this manual. It may have a solution to your problem.
2. Call us at 1-800-341-2288. We may be able to solve your problem over the phone.
   If the problem requires that you send your Pro100 to the factory for repair, we will provide you with a Service Order Number, which must be included on the outside of your shipping box.

Out of Warranty Repairs
For out of warranty repairs, include prepayment in the amount you were quoted by the Beltronics Customer Service Representative. If the detector has been damaged, abused or modified, the repair cost will be calculated on a parts and labor basis. If it exceeds the basic repair charge, you will be contacted with a quotation.

Beltronics Extended Service Plan
Beltronics offers an optional extended service plan. Call Beltronics for details at 1-800-341-2288.

Warranty and Accessories

BELTRONICS One Year Limited Warranty
What this warranty covers: BELTRONICS warrants your Product against all defects in materials and workmanship.
For how long: One (1) year from the date of the original purchase.
What we will do: BELTRONICS, at our discretion, will either repair or replace your Product free of charge.
What we will not do: BELTRONICS will not pay shipping charges that you incur for sending your product to us.
What you must do to maintain this warranty: Show original proof of purchase from an authorized Beltronics dealer.
